## BASED ON

Univox Superfuzz

## EFFECT TYPE

Octave Fuzz

BUILD DIFFICULTY
IIIII Intermediate

## DOCUMENT VERSION

1.0.1 (2021-04-08)

## PROJECT SUMMARY

A classic untamed fuzz from the 1970s that adds an octave-up overtone, famous for its use by Pete Townshend of The Who.

Actual size is $2.3^{\prime \prime} \times 1.86^{\prime \prime}$ (main board) and $2.3^{\prime \prime} \times 0.86^{\prime \prime}$ (bypass board).

1 Project Overview
2 Introduction \& Usage

## INTRODUCTION

The Rift Octave Fuzz is a recreation of the Univox Superfuzz, originally developed by the Shin-ei company in Japan in the late 1960s and called the FY-6. Shin-ei rebadged the circuit for over a dozen other brands such as Apollo, Electra and Hohner. However, the Univox Superfuzz was the most wellknown of the brands and today is considered the definitive version of the circuit.

The Superfuzz uses a phase splitter followed by a differential pair to emphasize the upper octave. It's very similar in concept to something like the fOXX Tone Machine, but with the major difference of using active transistors instead of diodes to rectify the signal.

The Rift includes one modification to lend more flexibility to the circuit. While the original unit only had a tone switch to go between two presets, this project provides the option of using a potentiometer to blend between them so it's not just full-on one way or the other.

The new 125B version of the Rift is identical to the previous one, except that the diode clipping switch has been removed in favor of a simpler layout that is easier to build. The previous version of the Rift is still available if you want that option.

## USAGE

The Rift has the following controls:

- Expander is the overall distortion or fuzz level of the effect.
- Volume controls the overall output of the effect.
- Tone switches between a mid-scooped filter and a flat EQ. Optionally, a pot can be used here instead of a switch to allow for blending between the two settings.

## PARTS LIST

This parts list is also available in a spreadsheet format which can be imported directly into Mouser for easy parts ordering. Mouser doesn't carry all the parts (most notably potentiometers) so the second tab lists all the non-Mouser parts as well as sources for each.

View parts list spreadsheet $\rightarrow$

| PART | VALUE | TYPE | NOTES |
| :---: | :---: | :---: | :---: |
| R1 | 22k | Metal film resistor, 1/4W | FY-6 uses 100k here. |
| R2 | 100k | Metal film resistor, 1/4W |  |
| R3 | 100k | Metal film resistor, 1/4W |  |
| R4 | 1k8 | Metal film resistor, 1/4W |  |
| R5 | 47k | Metal film resistor, 1/4W |  |
| R6 | 470k | Metal film resistor, 1/4W |  |
| R7 | 10k | Metal film resistor, 1/4W |  |
| R8 | 47k | Metal film resistor, 1/4W |  |
| R9 | 3k3 | Metal film resistor, 1/4W | FY-6 uses a jumper here. |
| R10 | 220k | Metal film resistor, 1/4W |  |
| R11 | 150k | Metal film resistor, 1/4W |  |
| R12 | 10k | Metal film resistor, 1/4W |  |
| R13 | 10k | Metal film resistor, 1/4W |  |
| R14 | 470R | Metal film resistor, 1/4W |  |
| R15 | 470R | Metal film resistor, 1/4W |  |
| R16 | 100k | Metal film resistor, 1/4W |  |
| R17 | 22k | Metal film resistor, 1/4W |  |
| R18 | 10k | Metal film resistor, 1/4W |  |
| R19 | 1k8 | Metal film resistor, 1/4W | FY-6 uses 2k here. |
| R20 | 22k | Metal film resistor, 1/4W |  |
| R21 | 100k | Metal film resistor, 1/4W |  |
| R22 | 47k | Metal film resistor, 1/4W |  |

| R28 | 10k | Metal film resistor, 1/4W |  |
| R29 | 1k | Metal film resistor, 1/4W |  |
| R30 | 100k | Metal film resistor, 1/4W |  |

## PARTS LIST, CONT.

| PART | VALUE | TYPE | NOTES |
| :---: | :---: | :---: | :---: |
| RPD | 2M2 | Metal film resistor, 1/4W | Input pulldown resistor. Can be as low as 1M. |
| LEDR | 4k7 | Metal film resistor, 1/4W | LED current-limiting resistor. Adjust value to change LED brightness. |
| C1 | 10uF | Electrolytic capacitor, 5 mm |  |
| C2 | 2 n 2 | Film capacitor, $7.2 \times 2.5 \mathrm{~mm}$ | FY-6 uses 1n here. |
| C3 | 10uF | Electrolytic capacitor, 5 mm |  |
| C4 | 100n | Film capacitor, $7.2 \times 2.5 \mathrm{~mm}$ |  |
| C5 | 10uF | Electrolytic capacitor, 5mm |  |
| C6 | 10uF | Electrolytic capacitor, 5 mm |  |
| C7 | 10uF | Electrolytic capacitor, 5 mm |  |
| C8 | 10uF | Electrolytic capacitor, 5mm |  |
| C9 | 10uF | Electrolytic capacitor, 5mm |  |
| C10 | 10uF | Electrolytic capacitor, 5 mm |  |
| C11 | 10uF | Electrolytic capacitor, 5 mm |  |
| C12 | 1n | Film capacitor, $7.2 \times 2.5 \mathrm{~mm}$ |  |
| C13 | 100n | Film capacitor, $7.2 \times 2.5 \mathrm{~mm}$ |  |
| C14 | 10uF | Electrolytic capacitor, 5 mm |  |
| C15 | 10uF | Electrolytic capacitor, 5 mm |  |
| C16 | 100uF | Electrolytic capacitor, 6.3 mm | Power supply filter capacitor. |
| C17 | 100n | MLCC capacitor, X7R | Power supply filter capacitor. |
| D1 | 1N5817 | Schottky diode, DO-41 |  |
| D3 | 1N34A | Diode, germanium, NOS | Can also use BAT41. |
| D4 | 1N34A | Diode, germanium, NOS | Can also use BAT41. |
| Q1 | 2N3904 | BJT transistor, NPN, TO-92 | Substitute. Original uses 2SC828, 2SC537, or 2SC539. |
| Q2 | 2N3904 | BJT transistor, NPN, TO-92 | Recommended to use 2N3904 (higher gain) for Q1-3 and 2N3903 |
| Q3 | 2N3904 | BJT transistor, NPN, TO-92 |  |
| Q4 | 2N3903 | BJT transistor, NPN, TO-92 | Also recommended to match Q4 and Q5 as closely as possible. |
| Q5 | 2N3903 | BJT transistor, NPN, TO-92 |  |
| Q6 | 2N3903 | BJT transistor, NPN, TO-92 |  |
| EXPND | 50kB | 16 mm right-angle PCB mount pot |  |
| BAL | 50 kB | 16 mm right-angle PCB mount pot |  |
| TONE | 50kB | 16 mm right-angle PCB mount pot | Optional modification - can use a potentiometer instead of a switch to blend between tone settings. |
| TONE | SPDT | Toggle switch, SPDT on-on | Omit if using tone pot. |
| OCTAVE | 10k trimmer | Trimmer, 10\%, 1/4" | Adjust for strongest octave. |

## PARTS LIST, CONT.

| PART | VALUE | TYPE | NOTES |
| :--- | :--- | :--- | :--- |
| LED | 5 mm | LED, 5mm, red diffused |  |
| IN | $1 / 4$ " stereo | $1 / 4$ " phone jack, closed frame | Switchcraft 112BX or equivalent. |
| OUT | $1 / 4$ " mono | $1 / 4$ " phone jack, closed frame | Switchcraft 111X or equivalent. |
| DC | 2.1 mm | DC jack, 2.1mm panel mount | Mouser 163-4302-E or equivalent. |
| BATT | Battery snap | 9V battery snap | Optional. Use the soft plastic type-the hard-shell type will not fit. |
| FSW | 3PDT | Stomp switch, 3PDT |  |
| ENC | $125 B$ | Enclosure, die-cast aluminum | Can also use a Hammond 1590N1. |

## BUILD NOTES

## Transistor selection

The original Superfuzz usually used 2SC828 transistors, sometimes 2SC537 or 539. There is nothing special about these transistors, but being early silicons, they were much lower gain than modern silicons. This makes a big difference in the circuit.

AionFX took measurements of an original Superfuzz as part of the development process for the updated version of the Rift. The transistors (2SC537G) tested as follows using a Peak Atlas DCA55:

Q1: 124 hFE
Q2: 95 hFE
Q3: 143 hFE
Q4: 62 hFE
Q5: 50 hFE
Q6: 52 hFE
In general, most people agree that the Superfuzz sounds best with higher-gain transistors at the beginning and lower-gain transistors at the end. If you have only six transistors, it's recommended to assign them using the following process:

1. The transistor with the lowest gain is used for Q6.
2. The two transistors closest in gain are used for Q4 and Q5.
3. Of the remaining transistors, the highest gain should go in Q1, second-highest in Q2, and thirdhighest in Q3.

It's recommended to use the 2N3904 for Q1-3. There aren't very many transistors available today that get down to the 50-60 gain range, but the 2N3903 is often under 100 and is a great choice for Q4-6.

The Rift PCB layout uses the USA-standard E-B-C pinout (2N3904, 2N5088, etc.) for the transistors, but an extra pad has been provided on each transistor footprint to support the Japanese E-C-B convention. If you do use a vintage transistor like the 2SC828 or 2SC945, make sure to adjust accordingly.

## Fine-tuning the octave

For the most pronounced octave effect, you want to make sure the Q4 and Q5 transistors are matched as closely as possible for gain (hFE). Most multimeters have an hFE function to test them. As you can see from the original measurements above, though, it can still sound great with transistors that are pretty far off from each other, so don't get too hung up on this aspect of the build.

The octave trimmer is there to compensate for unmatched transistors, and in fact Shin-ei implemented this trimmer because it was easier and cheaper than sorting for matched transistors. You will get the best effect if you use the two transistors that are closest in hFE for Q4 and Q5 and then use the octave trimmer to fine-tune the effect.

## DRILL TEMPLATE

Cut out this drill template, fold the edges and tape it to the enclosure. Before drilling, it's recommended to first use a center punch for each of the holes to help guide the drill bit.

Ensure that this template is printed at $100 \%$ or "Actual Size". You can double-check this by measuring the scale on the printed page.

Top jack layout assumes the use of closed-frame jacks like the Switchcraft 111X. If you'd rather use open-frame jacks, please refer to the Open-Frame Jack Drill Template for the top side.

LED hole drill size assumes the use of a 5 mm LED bezel, available from several parts suppliers. Adjust size accordingly if using something different, such as a 3 mm bezel, a plastic bezel, or just a plain LED.

## ENCLOSURE LAYOUT

Enclosure is shown without jacks. See next page for jack layout and wiring.

Shown with optional 9 V battery. If battery is omitted, both jacks can be mono rather than one being stereo. Leave the far-right lug of the DC jack unconnected.

## LICENSE \& USAGE

No direct support is offered for these projects beyond the provided documentation. It's assumed that you have at least some experience building pedals before starting one of these. Replacements and refunds cannot be offered unless it can be shown that the circuit or documentation are in error.

All of these circuits have been tested in good faith in their base configurations. However, not all the modifications or variations have necessarily been tested. These are offered only as suggestions based on the experience and opinions of others.

Projects may be used for commercial endeavors in any quantity unless specifically noted. No attribution is necessary, though a link back is always greatly appreciated. The only usage restrictions are that (1) you cannot resell the PCB as part of a kit without prior arrangement, and (2) you cannot "goop" the circuit, scratch off the screenprint, or otherwise obfuscate the circuit to disguise its source. (In other words: you don't have to go out of your way to advertise the fact that you use these PCBs, but please don't go out of your way to hide it. The guitar effects industry needs more transparency, not less!)

## DOCUMENT REVISIONS

1.0.1 (2021-04-08)

Corrected typo in transistor assignment on page 6.
1.0.0 (2019-02-01)

Initial release.
